

KI SCREENING TEST Canine NGAL Detection

The first and only rapid test for semi-quantitative detection of NGAL in urine for early screening of kidney damage in dogs

For professional in-vitro diagnostic use only

ANALYTICAL PERFORMANCES

(CI 95%: 95,67 – 99,86%)

(CI 95%: 90,23 – 99,67%)

(CI 95%: 96,06 – 99,70%)

PRINCIPLE OF THE TEST

KI SCREENING TEST is a lateral flow immunochromatographic device, for veterinary use, for semi-quantitative detection of NGAL in dog urine samples.

WHO ARE THE INTENDED USERS

The device is intended to be used by healthcare professionals in order to quickly determine the concentration of NGAL in dog urine, which is directly proportional to the severity of kidney damage and indicative of potential clinical settings.

HOW DOES THE TEST WORK?

1. Using the pipette provided, collect the urine sample.

2. Deposit 2 drops of sample into the diluent bottle.

3. Close the diluent bottle with the cap and mix by gently turning the bottle upside down.

4. Add 3 drops of the mixed solution to the test cassette and wait 10 minutes before reading the result.
